SYNOCURE® 887X-70

Product Application details	SYNOCURE® 887X-70 is a hydroxyl functional acrylic resin developed for use in compliant two component systems when cured with polyisocyanate. SYNOCURE® 887X-70 is low hydroxyl fast drying acrylic recommended for the formulations of general industrial applications.

Performance Benefits

- Good hardness
- Excellent gloss and Adhesion
- Fast drying

Polymer Type

- Solvent borne Acrylic

Sales Specifications

Solid Content at 125°C, % (ISO 3251, 1gm, 1h, 125°C)	68 - 72
Viscosity in Poise at 25°C, Brookfield Viscometer	80 - 100
Colour, Gardner scale (ISO 4830)	Max 1
Acid value, mg KOH/g (ASTM 3682)	Max 10

Other Characteristics[1]

Volatile	Xylene
Flash point, °C (ISO 3679)	24
Density / Specific Gravity at 20°C, g/ml (ISO 2811)	1.02
Hydroxyl Content, %	2.0
Hydroxyl Equivalent weight	850

Note: Acid value and/or Hydroxyl content quoted relative to solid resin

Formulation Guidelines

RECOMMENDATIONS FOR USE

SYNOCURE® 887X-70 should be mixed with the selected polyisocyanate just prior to application. The mixing ratio is not critical although it is preferable to use stoichiometric ratios to obtain optimum performance.

The reaction ratio is calculated from the respective equivalent weight or hydroxyl and isocyanate content of the reactants. The relationship is:

$$\text{Hydroxyl equivalent weight} = \frac{17 \times 100}{\%\ OH}$$

$$\text{Isocyanate equivalent weight} = \frac{42 \times 100}{\%\ NCO}$$

Using Desmodur N-75(1), the recommended ratios would be:

	on solid resin	as supplied
SYNOCURE® 887X-70	850	1215
Desmodur N- 75 (1)	191	255

At normal temperatures, the surface drying time of paints and varnishes based upon this combination is typically 50 minutes, with hard dry in 8 hours.

SYNOCURE®
BY ARKEMA

To increase the initial rate of cure of SYNOCURE® 887X-70 based paints and varnishes, at both ambient temperatures and under low bake conditions, the use of tin or zinc catalysts in the form of dibutyl tin dilaurate or zinc octoate is recommended. The levels will depend on the specific requirements but typical metal contents calculated on total solid resin would be 0.001% tin or 0.02% zinc.

SYNOCURE® 887X-70 can also be used in combination with amino resins in stoving systems like TSA resin. The suggested acrylic to amino ratio is in between 80:20 to 90:10 on solid resin. This system can be used to get good adhesion, gloss and chemical resistance properties.

The pot life of coatings based upon SYNOCURE® 887X-70 / Desmodur N 75 (1) in the recommended proportions gives a full working days use. Lacquers prepared at 23 seconds flow cup 4 at 20°C will double in viscosity after 30 hours. With a catalyst level of 0.001% tin on total solid resin this will be reduced to 10 hours. The catalyst used is dibutyl tin dilaurate

SOLUBILITY

The solvents chosen for paints and laquers based on SYNOCURE® 887X-70 should be free from water and not contain groups that react with isocyanates.

OTHER ADDITIVES

To optimize the performance of SYNOCURE® 887X-70, when used in a clear varnish formulation, we recommend the use of Tinuvin® 900 (2) and Tinuvin® 292 (2) in a 2:1 ratio.

Notes: (1) Bayer, (2) Ciba

Product Safety

Please refer to the corresponding Safety Data Sheet.

Storage & Handling

SYNOCURE® 887X-70 should be stored indoors in the original, unopened and undamaged container in a dry place at a temperature not exceeding 30°C. Exposure to direct sunlight should be avoided. In the above mentioned conditions the shelf life of the resin will be 12 months from the date of manufacturing.
